

You are invited:

AIA Continuing Education + Professional Learning

Over forty years of engineering and manufacturing water features has taught us a thing or two, and it makes sense to pass on our know-how to you, the designer. Fountains are so much more than the actual aesthetic you see; an intricate pumping system behind the scenes brings each fountain to life.

This course will introduce and explain all components used in a typical fountain application, so the designer will better understand the engineering process & language of aquatic consulting. Also, the course maps out a technical overview of design parameters for each type of water feature. These are all tools that every designer or architect needs to obtain in order to manage a successful and efficient design process.

- Learn the language of fountain design
- Step through the fountain development process
- Expose your team to the fountain industry's product standards and development trends
- Discuss topics associated with mechanically engineering different types of fountains

The idea is to make water feature application easier on the designer. It is really not that tricky once you get the basics.

**Hudson Grille
Brookhaven Station
4046 Peachtree Road
Atlanta, GA 30319**

6:30 - 8:30pm

RSVP:
